A: A two-dimensional Hausdorff space is regular, hence  $\mathbb{R} \times \mathbb{Z}_2$  is regular, hence for each  $p \in \mathbb{R} \times \mathbb{Z}_2$  there is a neighbourhood  $U$  of  $p$  such that  $U \cap (\mathbb{R} \times \mathbb{Z}_2) = \{p\}$ . The RTCA/ISMP has issued several new courses related to the Digital Train Control System. These courses are listed below: CS-1704-11: Digital Train Control System: The course is designed for railway operators interested in integrating digital signalling systems into their railway operations. The course describes the Digital Train Control System (DTCS) and presents information about the benefits of the system and how it can be used for train control applications. The course also describes the rationale for the DTCS standards and how these are used to coordinate the exchange of data between devices that operate with the DTCS. The course presents a digital railway network and demonstrates how the information from the network can be used to operate the DTCS. CS-1702-11: Digital Train Control System: The course is designed for railway operators interested in integrating digital signalling systems into their railway operations. The course describes the Digital Train Control System (DTCS) and presents information about the benefits of the system and how it can be used for train control applications.
