It's been seven years since the last major update to this familiar program, and while it may now be older than most of us, the fundamentals of image editing are still among the best in the world, and the user experience is still the smoothest. If most of your creative work involves images, for example, you'll probably prefer to spend your time on creating those images and not on changing them, and if that's the case, Photoshop Elements is the program for you. During the season in which we shot our test images it rained quite a bit, which created muddy conditions and a fair amount of grime. Which means that I haven't had the chance to test it with the various tools that were designed to clean up images. I'll say that Photoshop Elements, despite its relative lack of functionality, at least does a decent job of removing the grime that settled in during those rainy weeks, making it work for those rainy days after the fact. Another "tweak" is a new ability to create matting masks. I haven't used them, but, according to the instructions, "matting masks determine the edges of elements that you want to keep in a photo. A mask acts as a 'window' that isolates specific areas of your image and lets you work on those areas with the rest of your image remaining untouched." Matting masks don't have the same efficiency and flexibility as masking layers, but that will presumably change as Photoshop learns more about the manipulation of images. This is most evident in the new Smart Sharpen feature, which automatically corrects images. Whether it's Smart Sharpen or the new Lens Correction or Auto Smart Tone, all new features are designed to improve image quality, but once you've used them, you spend less time tweaking, and more time editing. A fast processor and a large amount of memory lets you render large, detailed images in real time. The results supersede the quality of older versions of Photoshop.

In an interview with Macworld, Photoshop team leader Chris Reilly listed a few items to keep an eye on in the future:

- *Native GPU access*: With the introduction of the Apple silicon for Macs, the team is working with Apple for an all-new vector graphics API (DNG) and shader-based communications protocol to establish native GPU access to Photoshop. This technology has been available in other products for a decade, and it's a positive sign that Apple and Adobe want to bring the feature to Photoshop.
- *Open layers*: To reduce the need for supporting an increasing array of low-level details in the underlying GPU APIs, the team looks to the wider vector graphics stack.

Get started on building your own Lightroom presets in the upcoming Adobe Lightroom CC 2020 update. In this tutorial by Jeffrey Rudell, you'll learn how to build custom presets to use in Lightroom and Photoshop back using the proprietary Adobe Preset Manager file. There's a lot of speculation about Adobe's future involving the anticipated launch of Photoshop and the newer native GPU APIs introduced by Apple. The latter, in particular, is exciting for Mac users, who have long demanded that Photoshop use the native APIs and not the older single-threaded applications that have been used in the past. With that in mind, how are those changes changing the look of the product, and is it making an impact on the direction of the product? The team has been busy testing native GPU access and is actively working on both macOS and Windows releases. Looking ahead, he noted that the team is mindful of its users' needs and wants a product that "just works", and that it is planning to make sure that the Photoshop experience is consistent between platforms. That means, as one example, that it will remove limits on the number of layers with masking.
